

Model 400SBD γ C

HIGH PERFORMANCE TRITIUM IN AIR PORTABLE SURVEY MONITOR

SENSITIVITY

The 400SBD γ C is useful for measurements as low as 2 μ Ci/m³. The new OTC electrometer, which measures to below 10⁻¹⁶ amperes combines low noise and high zero stability. Unlike other instruments, the 400 series instruments no longer require a front panel manual zero control. Thermally induced zero shifts of the electrometer and associated electronics have been eliminated.

RADON INTERFERENCE, NOISE RESPONSE

For an unambiguous measurement of very low tritium a monitor must be able to ignore response to ambient radon. The 400SB Series incorporates this capability and therefore produces accurate, fast and drift free measurements to nearly +1 μ Ci/m³.

TOTAL GAMMA COMPENSATION

Cruciform ionization chamber geometry provides nearly perfect gamma compensation regardless of photon energy, flux gradient or flux direction. Gamma compensation of the 400 series instruments is typically three orders of magnitude better than instruments using nested or side by side ionization chambers.

FAST RESPONSE

Its exceptionally rapid response is uniquely due to its ability to ignore radon. The electronic time constant is only 10 seconds, the pneumatic time constant of about 12 seconds, for an overall time constant of only 15 seconds. Meter readings will reach 90 % of final value within 30 seconds to a step response of aspirated tritium.

FAST WARM UP, NO ZERO DRIFT

After applying power, the initial transient "warm up" drift effects take less than a minute. Long term drifts have been eliminated, manual zero adjustments are no longer required.

HTO DISCRIMINATION (MODEL 400SBD γ C-HTO)

By addition of a desiccant column, this survey instrument will specifically measure HTO in the presence of other radioactive gases as well as background gamma. The desiccant can be regenerated repeatedly for reuse.

High Sensitivity	to 2.0 μ Ci/m ³
Fast Response	10 second time constant
Gamma Compensated	virtually no offset in 10mR/h fields
No Response To Radon	ensures complete zero stability
No Zero Drift Rapid	long term zero stability to better than 1 μ Ci/m ³
Warm Up	less than 30 second warm-up

The Overhoff Technology Corporation Model 400SBD γ C portable tritium monitor is an instrument with unequalled performance in sensitivity, stability, speed of response and gamma compensation.

NOBLE GAS DISCRIMINATION: MODEL 400SBD γ C -HTO ONLY

A special version of the basic 400 series instrument is for measurement of tritium (oxide) in the presence of radioactive noble gases. By addition of a desiccant cartridge, this instrument will respond solely to HTO, ignoring all other airborne radio nuclides and gamma fields.
