PASS THROUGH PACKAGE, CART OR LAUNDRY MONITOR

Model ~ LIM-PC-6

DESCRIPTION:

Model LIM-PC-6 is a high sensitivity Beta-Gamma Monitoring system for determining possible radiation contamination in laundry, carts, packages, personnel, or hazmat (PPE) garments. The 'pass through' between two towers, each with 3 plastic scintillation panels, can be direct straight through or pausing between the towers for higher sensitivity. Optional Neutron detectors.

Plastic scintillation panels have higher sensitivity than cylindrical shaped scintillation crystals due to the larger surface area.

Background is continually updated and subtracted thus giving net contamination reading.

- **LIM-PC-6** includes the electronic control/alarm feature with (6) plastic scintillation panels, (3) in each tower, and a PM tube with 792 in³ volume and a sensitive area of 528 in² in each detector. Total sensitivity area of 2210² in each tower.
- Fast rate of change electronics with audio and visual alarms.
- Operates from 110/220 AC power main; optional battery back-up.
- Since the operation of this instrument is based on rate of change in radiation, it will reliably pick up contamination as it passes near the monitor.
- Video capture of 'pass through' triggered by alarm.
