APPLICATION:

The PFAS-TA Series Vapor detectors and analyzer is a field ready fully integrated system for air, solids, or water. With an internal sampler pump and integrated compute. Model series **PFAS-TA identifies vapors as low as 1 PPT (parts-per-trillion) in just 5-60 seconds.**

EPA's proposed regulation limit for PFOA and PFOS is 4 ppt. The PFAS-TA provides immediate measurement of PFOA and PFOS. Typical laboratory analysis is expensive and may take a week or more for results.

Rapid, on-the-spot PFAS contamination testing below the EPA's limit and can be configured for either water or air samples.

Multi-Chemical analysis provides immense application diversity for the PFAS-TA model series of detectors for many industries.

A proprietary Surface Acoustic Wave (SAW) detector results in a system with previously unattainable sensitivity in a portable low-cost package.

### DESCRIPTION:

- Carrier Gas: Helium, Typical 300 tests per day per charge
- Analysis Time: 5 – 60 Seconds
- Display: Windows any version

Utilizing a trap and helium carrier gas, the PFAS-TA models inject samples into a heated column and separation takes place. Materials sequentially exit the column and are deposited on the SAW detector. The deposit results in a change in the oscillating frequency of the resonator directly proportional to the mass.

### UNIQUE DETECTION:

- Recognizes full chemical signature
- Provides a complete chemical profile
- Has an expandable library of 700+ chemical signatures
- Ultra-high-speed chromatography
- Same time pattern recognition and trace detection
- Adapts and learns to recognize threat signatures

## THE PFAS AND MULTI-CHEMICAL DETECTION SYSTEM EXPLAINED

Sheet of AEM membrane  
(20.40.140.100 Pump 10sec) Weight 364mg slice

## EXAMPLE

Weight is AEM Membrane: 364mg slice

Heated to 32° C (89.6° F)

The graphic shows that there is PFOA and PFOS present

## HOW IT WORKS

- The Q surface acoustic wave (SAW) interferometer is the key component.
- Individual analyte peak half-width is measured in seconds.
- Every picogram of material is collected on the surface of the temperature-controlled quartz crystal.
- An image of the chemical pattern is obtained from the frequency of the SAW resonator.
- The SAW interferometer produces a resonance frequency proportional to the amount of column effluent deposited on the quartz surface.
- A complex ambient environment is viewed and electronically recognized via its image.
